Roll No: 10

Section: K17DM

School of Computer Science and Engineering

Lovely Professional University

Phagwara, Punjab (India)

DECLARATION STATEMENT

I hereby declare that the case study entitled "ONLINE DOCTOR (Robust.com)" submitted at Lovely Professional University, Phagwara, Punjab is an authentic work and has not been submitted elsewhere.

I understand that the work presented herewith is in direct compliance with Lovely Professional University's Policy on plagiarism, intellectual property rights, and highest standards of moral and ethical conduct. Therefore, to the best of my knowledge, the content of this case study represents authentic and honest effort conducted, in its entirety, by me. I am fully responsible for the contents of my case study report.

Signature of Candidate

Rahul Rathore

R.No.....

ACKNOWLEDGEMENT

I would like to express my special thanks of gratitude to my teacher Mr. Inderjit Singh as well as my university , Lovely Professional University who gave me the golden opportunity to do this wonderful project on the topic Online Doctor, which also helped me in doing a lot of Research and I came to know about so many new things I am really thankful to them.

Secondly i would also like to thank my parents and friends who helped me a lot in finalizing this project within the limited time frame.

CHAPTER 1 : SRS DOCUMENT

1.Introduction

“Health is Wealth”

Robust.com will be the digital way to see the Health-care industry and things like treatments and medicines will be a touch away from us. Robust.com will be delivering treatments in a faster and medicines at a convenient way.

1.1 Purpose

The main intend of this project is to be the digital way of serving people having health related issues. Users will be able to get diagnosis from a the system by answering some questions related to the symptoms and will be advised to take the medicines from the local chemist which would be available without prescription or can take an appointment from the doctor online and have a video chat with him and get an electronic generated prescription and can even order medicine online at their doorstep.

1.2 Document Conventions: Font : Times Now Roman 12

1.3 Intended Audience and Reading Suggestions

The document is intended for all the stakeholders customer and the developer (**designers, testers, maintainers**). The user is assumed to have basic knowledge of English ,Computers and Computer operations. Knowledge and understanding of UML diagram is also required and a rough ideas to understand the system from the given documentation.

1.4 Definitions and Abbreviations

1.4.1 Definitions

- **Account**

A single account on the website which will be unique per user and one user is not allowed to have more than one account. User's account would be used to access all the features and services offered.

- **Admin**

Administrator. He is the sole authority to Modify the user accounts from the server end and is responsible for Modifying and Verifying User Accounts is asked.

- **User**

The holder of one account on the website. A user account can be maintained/accessed by anyone they shares their password with , the correspondence is not relevant to this problem.

- **Doctor**

The users with knowledge in medical field and has practice experience of at least 5 years and marks above certain qualifications marked up by the developers

- **User Id**

A unique ID assigned to both; The Users and Doctors once they open an account on the database. Each User's ID starts with a 'u' and Doctor's ID starts with 'd'. Different formats helps the system and the developers to show up things and features differently. Each account is owned by a single user, but multiple users can be their if password is being shared, so the possibility of simultaneous use of the same account from different locations must be considered.

- **Stock**

Total collection of a given medicine in the warehouse which can be directly checked by the user it self.

- **Consultation**

A video/Audio/Textual interface set up between user and doctor where they can talk. All the data would be encrypted and both user, doctor and the system can get the conversation done between both only on request.

- **MySQL**

The database management system that would provide efficient and flexible access to the database containing user data.

- **JSP**

Java Server Pages , it'd provide the website to be dynamic and have dynamic web content.

- **UML**

Unified Modelling Language, Language for software blueprints. It'd help to make the document in a visual base.

- **HTTPS**

Hyper Text Transfer Protocol Secure , would be the service protocol to enable secure connection between user and the server.

- **CSS**

Cascading Styling Sheet , the language used to make client side more interactive .

1.4.1 Abbreviations

Throughout this document the following abbreviations are used:

- k : is the maximum requests a user can make in a day from one account.
- m: is the maximum quantity a user can request medicine for.
- n : is the minimum cash to be paid for consultation
- t : is the total stock available in the warehouse of medicines.

1.5 Project Scope

Robust.com supports a computerized health care network. The network enables users to diagnose simple problems by answering some simple questions and diagnose for other diseases by consulting the Experts being available online through a web interface. The Website identifies a user by his credentials , i.e. User Id and Password. It collects information about the user's health,age . gender and saves up them in the data base. The Admin is having different approach towards the services.The doctors are having a different interface with different features.The database is keeping all the records . The software must handle concurrent accesses to the same account correctly without going down.

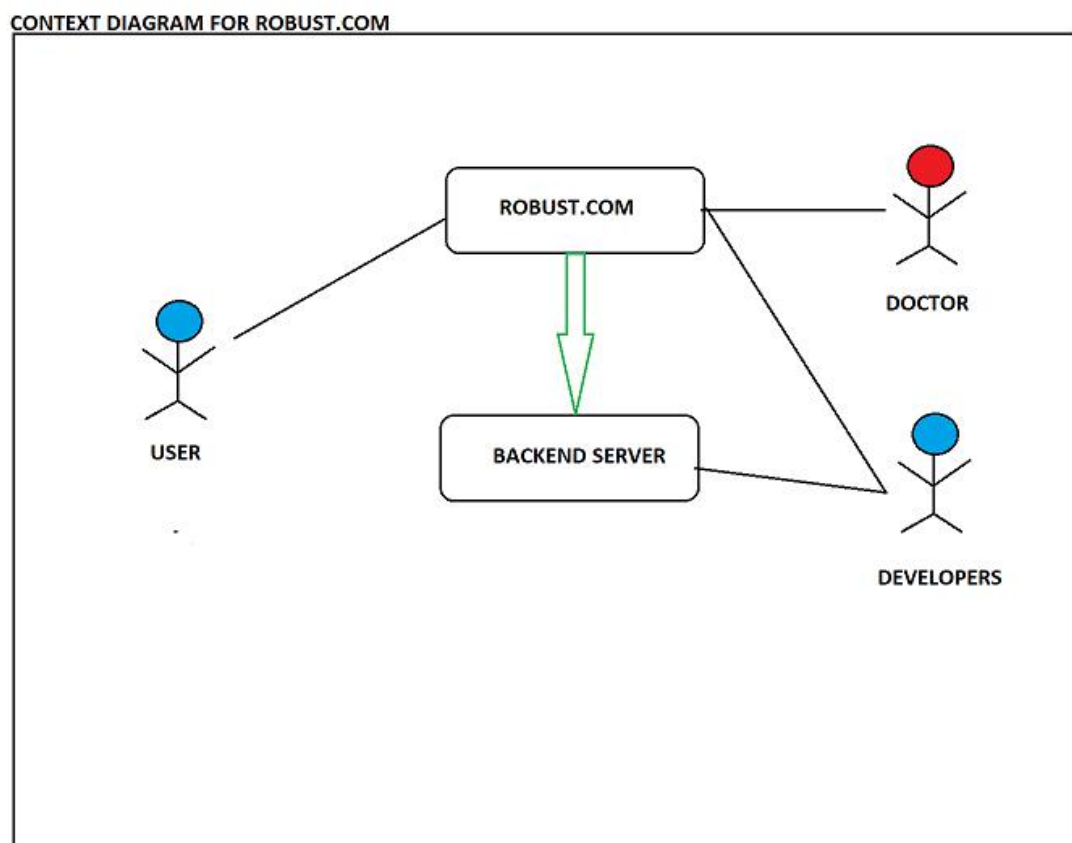

Fig. 1 : Context diagram for System

2. Overall Description

2.1 Product Perspective

The website network does not work independently. It works in parallel of both, user side and client side server and both the servers are connected to the database which is being updated at every instance whenever some changes are being observed.

Communication interface: The website communicate with the database via a communication network.

Software interface: The commands and updates sent via the communication network are specific to the target database. At present, single database would be there participating in this.

Hardware interface: The software will run on any basic computer which has an internet connection and can even run on mobile phones supporting internet connections.

User Interfaces

Customer: The user interface should be intuitive, such that 99.9% of all new users are able to complete their tasks without any assistance.

Admin: Admin is responsible for removing/adding users on requests. The doctors can only be approved once Admin views the supported documents uploaded by them and verifies it.

Maintainer: The maintainer is responsible for adding new features to the website and maintaining existing website. A maintainer should be possible to add a new feature to the website within minimum time and without taking down the website for longer duration .

2.2 Product Features

The website should work 24 hrs. The website identifies a user by a user id and password. It collects simple data about user and keep it in the database. User can

diagnose himself by answering some simple questions. For other times, he can simply consult to a available doctor and can get real-time assistance online. The database required enough security measures to keep the server safe and secure. User credentials must be stored in encryption so that they can't be altered through some other agencies in any case. The software must handle concurrent accesses to the same account correctly.

2.3 Operating Environment

The hardware, software and technology used should have following specifications:

- Ability to validate the user
- Ability to add user images
- Active Internet Connection
- Continuous power supply
- Ability to connect to user with the system
- Ability to take input from user
- Ability to validate user
- Ability to assign a single available doctor
- Ability to establish a secure connection between user and doctor.

2.4 Design and Implementation Constraints

- Login

Validate User:

- Validate for User's login details
- Validate that the User is entering correct details

- If details are wrong, prompt error message "WRONG CREDENTIALS"

Validate for Forgotten Credentials:

- Validate if No. Of login attempts are more than 3
- If Password is forgotten, prompt error message, "Use Mobile number to reset"
- If User is forgotten, prompt error message, "Use Find my account section to Access your account back"

Validate for Disabled Account:

- Validate the disabled account
- If account is disabled, prompt error message, "Sorry, Your Account has been temporarily disabled <No. Of Unsuccessful attempts exceeds the allowed limit>"

Validate Password:

- Validate that the password is not blank
- If Password is blank, prompt error message "Password field is Empty"
- Validate that the password entered matches the password on file
- If password does not match, prompt error message "Password is Incorrect"

Lock Account:

- If number of consecutive unsuccessful login exceeds three attempts, lock account temporarily
- Maintain Consecutive Unsuccessful Login Counter
- Increment Login Counter
- For every consecutive Login attempt, increment logic counter by 1.
- Reset login counter to 0 after login is successful.

Time Out Constraint:

- Check the user continuously and track activities

- If no activity is observed for consecutive 90 seconds
- Logout User and display < “ SERVER TIMED OUT” >

2.6 Assumptions and Dependencies

- System has an up time of 100% and never goes down.
- Active and stable internet connection is there.
- User Shares his correct credentials and problems.
- Single Login from one Id at one time.
- User has a device that can download/upload images.

3.

3.1 Functional Requirements

The functional requirements are broadly written into a single section , i.e. requirements of the user and are validated accordingly.

3.1.1 Requirements of the Users

The requirements for the User are organized in the following way General requirements, requirements for authorization, requirements for a transaction/Consultation.

General

Functional requirement 1:

- **Description:** Initialize a user by signing him up.
- **Input:** User is assigned user id and password of his choice
- **Processing:** Storing the credentials in the database.
- **Output:** Credentials are set. User is created

Functional requirement 2:

- **Description:** If no doctor is available at the moment for consultation , the system should display Queue Number.

Functional requirement 3:

- **Description:** If the doctors aren't available at a particular moment An error message is displayed.
- **Input:** A doctor is Searched for consultation from 'COUNSULT NOW' option.
- **Processing:** The vacant doctors are searched at the particular instance and a list is being generated accordingly in contrast to their specialization.
- **Output:** Display an error message.
- **Authorization:** The authorization starts after a user has entered his user id and password.

Functional requirement 4:

- **Description:** The System has to check that customer enters Correct Credentials
- **Input:** Customer enters the user id and password.
- **Processing:** Check if it is a valid credentials by verifying from the database. It will be valid if
 - The information entered can be read.
 - It is not wrong and matches with one that is saved in database.
- **Output:** Display error message and return login screen if it is invalid else establish connection.

Functional requirement 5:

- **Description:** If the credentials is valid, the system should read the user id's initial to check the user type.

- **Input:** Valid User Details
- **Processing:** Read the initials of the user id.
- **Output:** Initiate authorization dialog accordingly.

Functional requirement 6:

- **Description Authorization dialog:** The user is requested to enter his password. The system verifies the user id and password with the one in database/
- **Input:** Password from user, User id.
- **Processing:** Verify for correctness and return true if it matches the database.
- **Output:** Accept or reject authorization from the server.

Functional requirement 7:

- **Description:** Different negative answers from the server for authorization dialog.
- **Input:** Response from server or authorization dialog:
 - “Bad password” if the password was wrong.
 - “Bad User Id” if the Id doesn’t matches with the one present in database.
 - “Bad Account” if there are problems with the account.
- **Processing:** If the User End gets any of these messages from the server, the login would be failed and user would be shown relevant display message.
- **Output:** User is Logged out and prompted to login screen and error message is displayed.

Functional requirement 8:

- **Description:** If password and user id are Correct, the authorization process is finished.
- **Input:** The user gets accepted from the server from authorization process.
- **Processing:** Finishing authorization.

- **Output:** Start menu for website dialog.

Functional requirement 9:

- **Description:** If the password is entered wrong for several number of times , user is asked to verify himself by resetting the password by the registered phone number. A message will be displayed that the user has to reset the password to login again.
- **Input:** Entering a wrong password for the five time in succession
- **Processing:** Initiate authorization process Response from server is to temporally lock the account.
- **Output:** Display error message that the customer should use the reset option now.

Functions: These are the requirements for the different functions the System should provide after authorization.

Functional requirement 10:

- **Description:** Kind of Transaction user wants to do(e.g Consultation,Get Insured ,Order Medication etc)
- **Input:** Authorization successfully completed. Select input from various listed options.
- **Processing:** Option is selected and processed side by side.
- **Output:** Separate screen with those details would be opened.

Functional requirement 11:

- **Description:** User is connected to the doctor for consultation
- **Input:** Customer has chosen the doctor and paid the consultation fees from his account
- **Processing:** Error if the doctor isn't available at that instance or fees isn't being paid yet.

- **Output:** Start connecting again or re-initiate transaction dialog if the amount is not being paid yet..

Functional requirement 12:

- **Description:** Perform transaction.
- **Input:** Initial step was successful.
- **Processing:** Send request to the database to set up a connection.
- **Output:** Wait for response from the merchant's server. On success, A connection is settled up between user and the Doctor.

Functional requirement 13:

- **Description:** If the Consultation was successful, User is provided option to order medicine and get e-prescription.
- **Input:** Server gets message "transaction succeeded" from user's end computer.
- **Processing:** System generates a report electronically signed by consulted doctor and sent to user via email and shown on screen.
- **Dialog:** You may keep the report for further purpose.
- **Output:** After the Customer has taken the report, he's prompted to buying medication page.

Functional requirement 14:

- **Description:** If interested, user can buy medication online.
- **Input:** The consulted medicines are automatically shown up on the screen.
- **Processing:** System checks the given report for prescription and give the list of medication being suggested to the user
- **Output:** User is asked to complete transaction or can abort the screen.

Functional requirement 15:

- **Description:** If the user has aborted the screen he's being redirected to the main page..
- **Input:** System gets message "transaction aborted" from the server.
- **Processing:** User End displays Pop up Message. Dialog: You'll be redirected within a moment
- **Output:** Redirected to the main page

Functional requirement 16:

- **Description:** If the user has chosen "Get Insured".
- **Input:** System pops message "You'll be redirected to affiliate's page".
- **Processing:** User End displays List of affiliates offering Insurances and list of hospitals where they are partnered in a alphabetical order
- **Output:** Redirected to the Insurance Page

Functional requirement 17:

- **Description:** If the user signs up for the very first time
- **Input:** Ask for Email, Password and all basic information regarding to the user (e.g Name,Sex,Age,Blood Group ,Allergies etc)
- **Processing:** All the data is being stored and email is being validated
- **Output:** Login to User Account

External Interface Requirements

3.2 User Interfaces

The customer user interface should be intuitive, such that 99.9% of all new users are able to surf and navigate on the website without any assistance and problems.

3.3 Hardware Interfaces

The hardware should have following specifications:

- Ability to read the user inputs
- Touch screen for mobile connections
- Stable and an Active internet connection.
- Ability to connect to data base
- Ability to give outputs to users through a display.
- Ability to validate a user

3.4 Software Interfaces

The software interfaces are specific to the target website and user consultation systems.

5.Other Nonfunctional Requirements

5.1Performance Requirements

- It must be able to perform in unstable connections also..
- Uninterrupted interrupted connections
- High data transfer rate
- Able to handle many users at a time.
- Quick Response every time.

5.2 Safety Requirements

- Must be encrypted in the back-end
- Must be DDoS protected.

- Must have a detection technique for distinguishing between bots and Humans.
- Must be able to detect illegal/impermissible commands.

5.3 Security Requirements

- Users accessibility is censured in all the ways
- Users are advised to change password every two months
- Users are advised not to share their account with anyone
- The maximum number of attempts to enter password will be five

5.4 Software Quality Attributes

Security

Performance.

5.4.1 Availability: The website has to be available 24 hours a day with at least 100 doctors online at minimal.

5.4.2 Security: The network should provide maximal data security .In order to make that much more transparent there are the following requirements:

1. It must be impossible to plug into the network.
2. It must be impossible to interrupt / peek through one's connection

5.4.3 Maintainability: Only maintainers are allowed to maintain the system and the server .

6. Other Requirements

6.1 Data Base

The system must be able to use several data formats according to the data formats that are provided by the data bases of different users.A saved user data must have all the required attributes, i.e Atomicity, Consistency, Isolation, Durability.

6.2 Constraints

- Internet connection is a major factor.
- Only one active session is permissible at one time.
- Password must always be hidden behind special characters.

CHAPTER 2 : SOFTWARE DESIGN DESCRIPTION

Modelling Requirements :

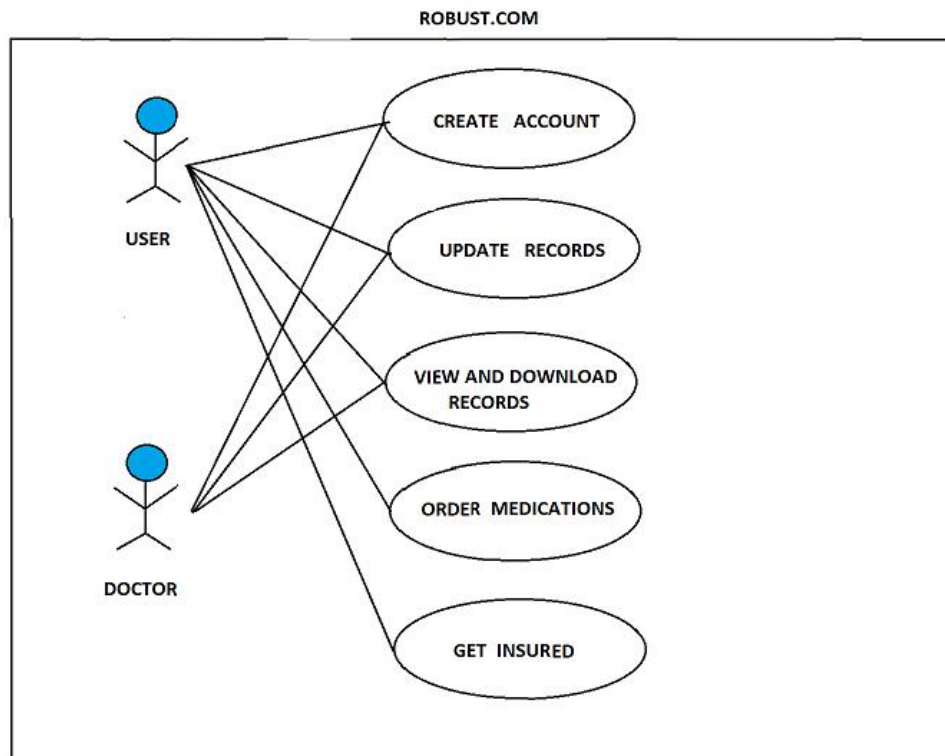

Fig. 2 : Interaction of user and features

Robust.com is having mainly 2 kind of users. One being the doctor itself and the second is the patients. Both will have a different approach towards the system.

User Creates an Account :

Use Case : Create and Account .

Diagram

Description : User Visits Robust.com and Signs up for a new Account

User Update Use Case :

Use Case : User Updates his record which are already present on the database .

Diagram

Description : User Access his/her account and make some changes in the already present attributes.

User View Use Case :

Use Case : User Requests to show his records and details

Diagram:

Description : User Access his records and sees his medical record history with date and consultation charges being charged to him.

User Order Medication Use Case :

Use Case : User Opens portal where he wants to order medication at his door step.

Diagram

Description : User being shown a list of prescribed medicines and a search bar to search medicines. Whenever user enters a medicine , he's shown the price and an option to order it.

User Get Insured Use Case :

Use Case : User Opens portal where he wants to Get Health Insurance done online.

Diagram

Description : User is redirected to a page where he can get health insurance under the name of Robust but from a third party affiliate.

Doctor Create Account Use Case :

Diagram

:

Description : Doctor is being allowed to sign up with some special privileges that comes under his account. He's being asked about his qualifications, specializations and other personal details with a proof and is being verified by the team and reported in a week.

Doctor Update Account Use Case :

Diagram

Description : Doctor is being allowed to update is records i.e his personal details.

Doctor View Record Use Case :

Diagram

Description : Doctors are being allowed to download and view the records of the patients they have ever assisted and can check user's current health on that basis.

Modular Diagram depicting Robust.com's features :

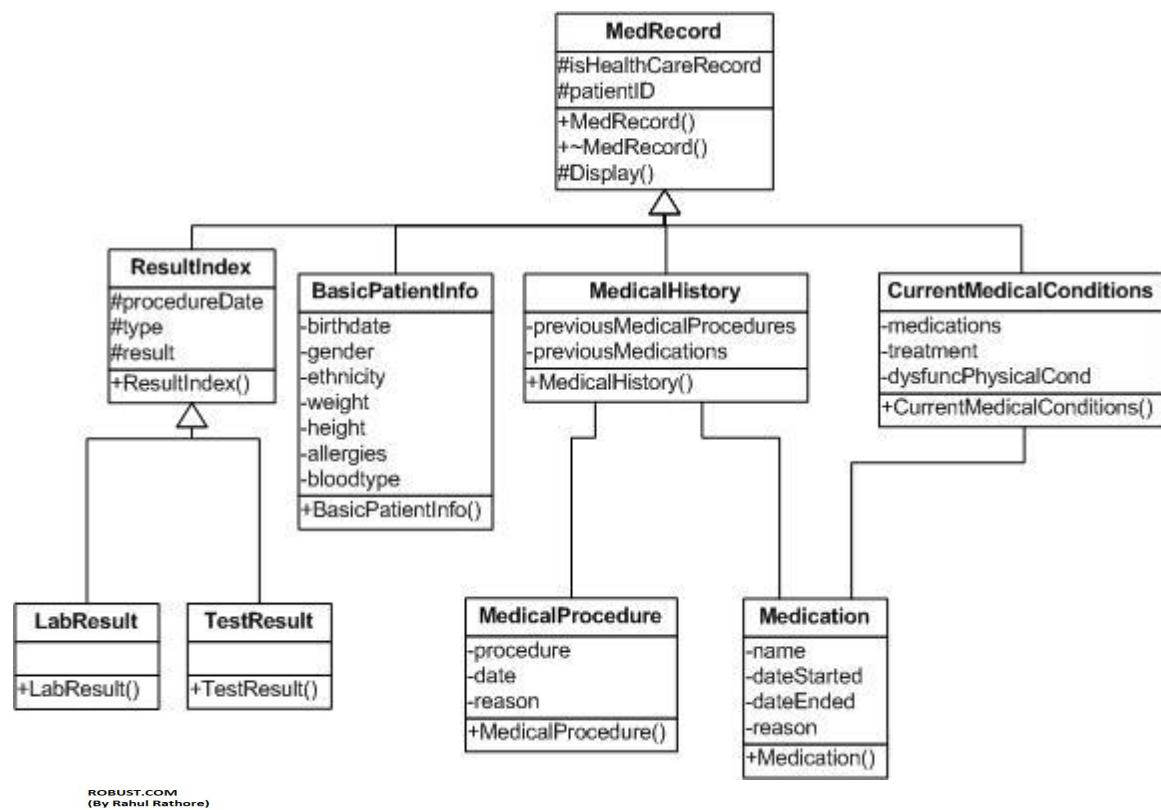

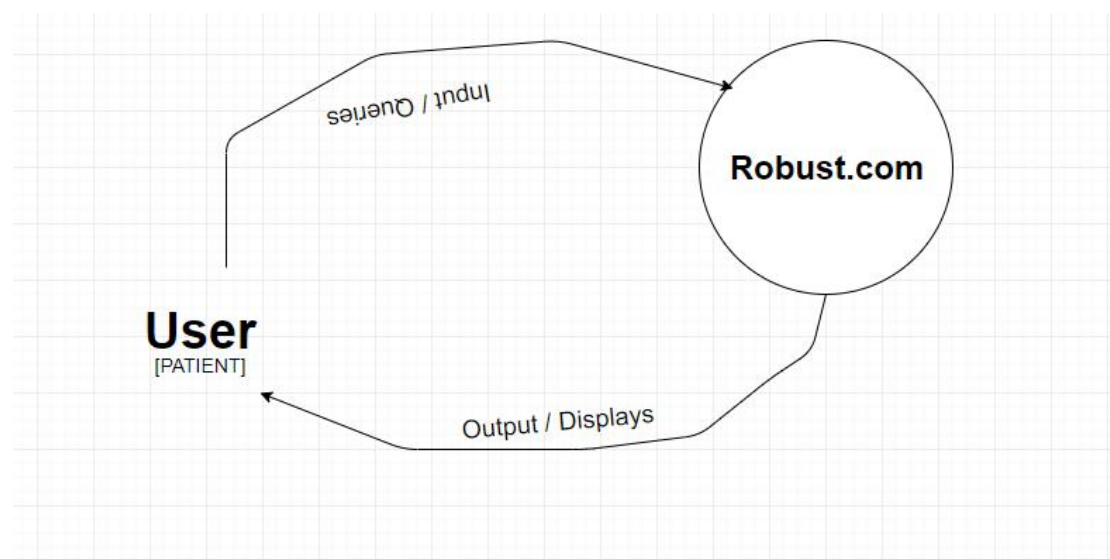

Fig 3: Showing Functional approach for the Robust.com

Data Flow Diagram(DFD) for Robust.com :

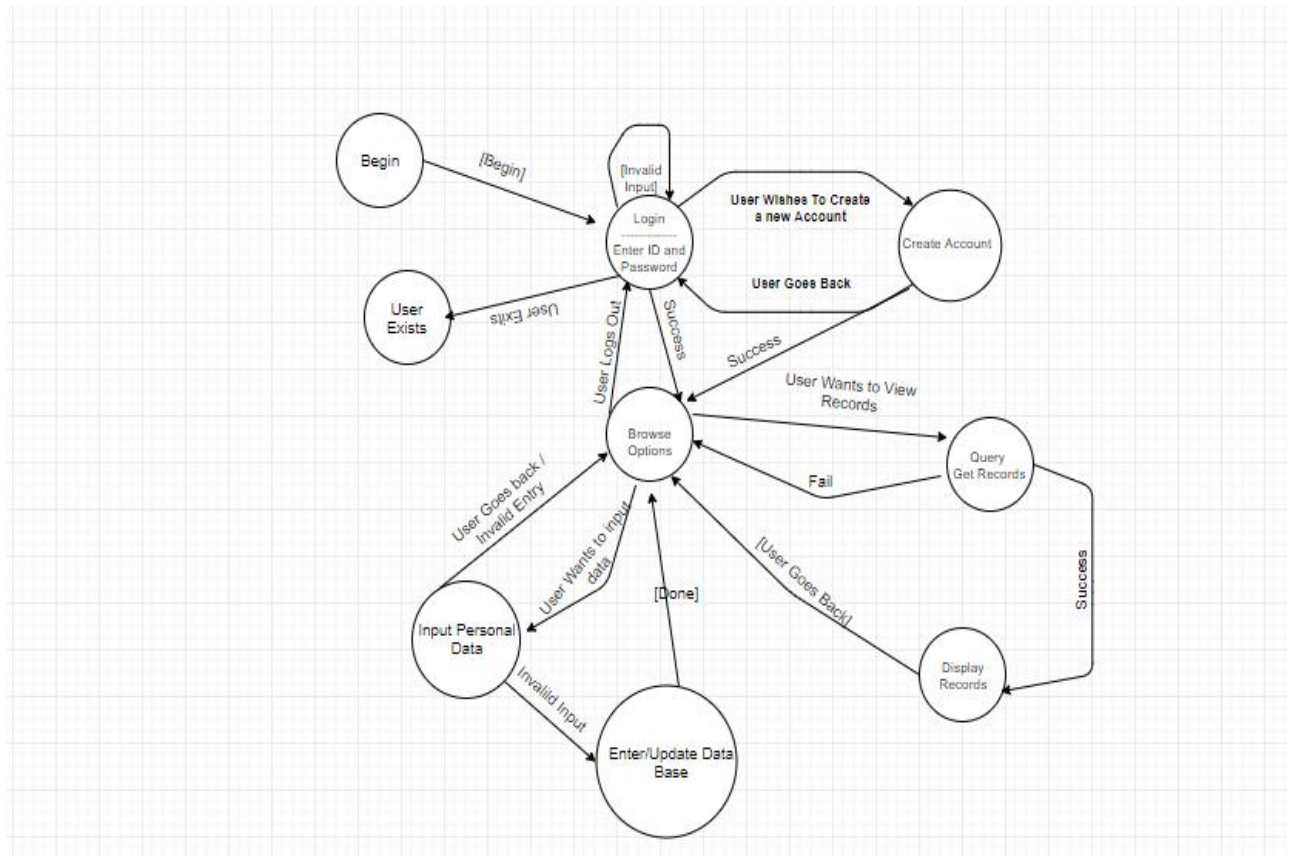

Patient View :

Level 0 :

Description : Context level diagram for the System.

Level 1 :

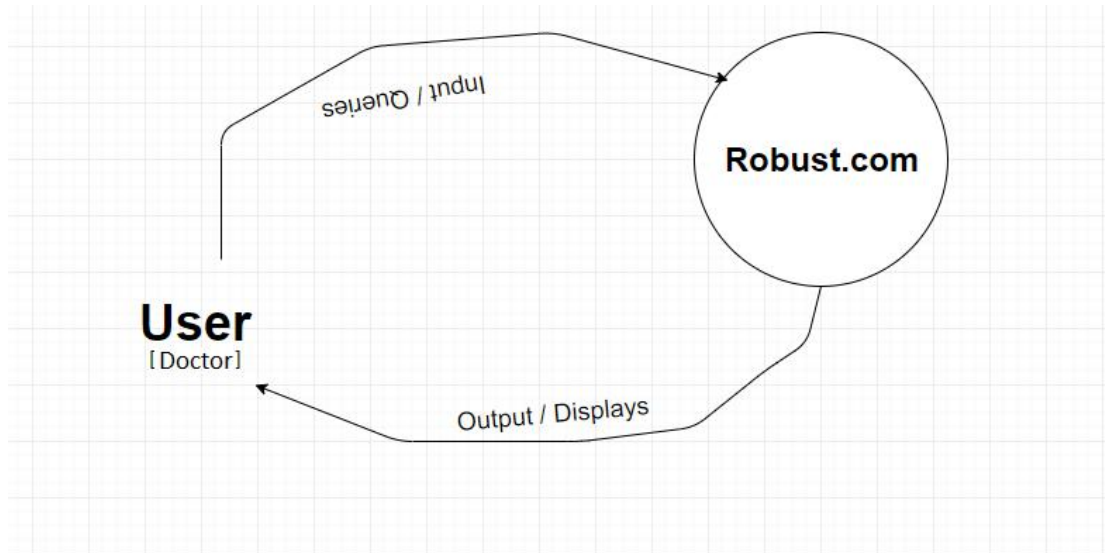

Description : Once a Patient enters a website ,he's being asked to login. If the credential enters doesn't matches the saved one's , he's being showed error and asked to re-enter them.After a successful login , patient is being promoted to the website with a secure connection. Once he enters the main website, he is shown various options regarding the features provided on the website.User can select show, update and other record related queries.

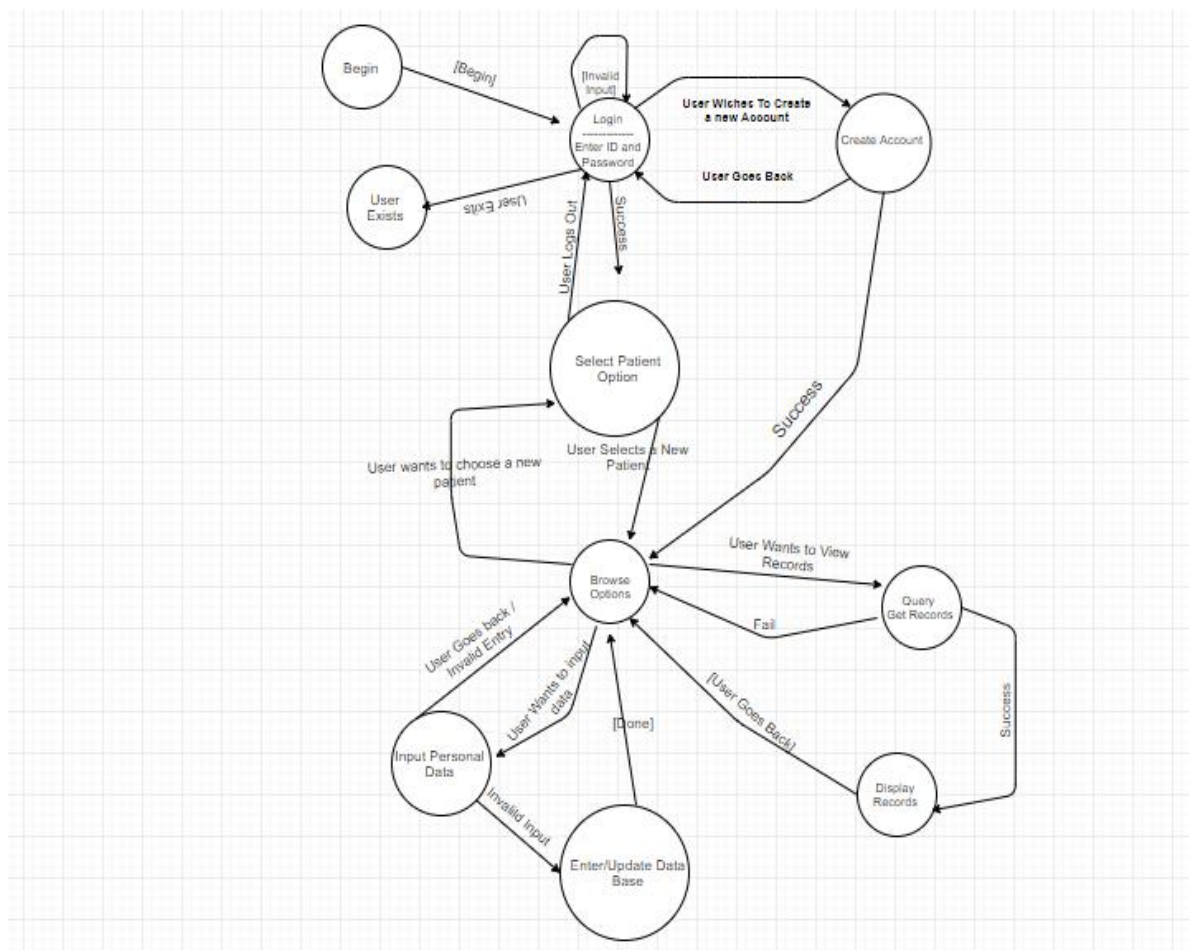

After successfully doing the work, user is being logged out automatically and if he wishes to perform any action, he's again being asked to login and perform his work.

Doctor's View :

Level 0:

Level 1 :

Description : Every Doctor visiting the website is being firstly asked to login/ sign up. On successful login, he's being shown various operation he can perform on his account and patient's record . Doctor chooses one and is being shown the further things in accordance to that.

After completing his work , he is being logged out and is being asked to login again if he wants to visit the system again.

CHAPTER 3 : MANUAL TEST CASES

Test Case (Login Test)

Test Case # : 02	Test Case Name : Availability Check	Page : 1 of 1
System : User Device	Sub-System :Database	
Designed By : Rahul	Designed Date :24/09/18	
Executed by : ABC	Execution Date : 25/09/18	
Short Description : Test the login credentials and its validity		

Pre Condition : 1.User is already having an account.
2. User knows his Password and User Id
3. The system displays Main Page

STEP	ACTION	EXPECTED RESPONSE	PASS/FAIL	COMMENT
1	Click login button	Web page for login opens up	Pass	-
2	User Enters his credentials and clicks login	Credentials are matched and connection is being set up	Pass	-
3	User sees his Account	Login is being done	Pass	-

Post Condition : User is being logged in successfully
--

Test Case (Simple Connection Test)

Test Case # : 02	Test Case Name : Login Test	Page : 1 of 1
System : User Device	Sub-System : Password	
Designed By : Rahul	Designed Date :22/09/18	
Executed by : BCS	Execution Date : 25/09/18	
Short Description : Test the availability of doctor		

Pre Condition : 1.User is online and searching doctor.
2. Doctor is online and vacant

STEP	ACTION	EXPECTED RESPONSE	PASS/FAIL	COMMENT
1	Click find doctor	All available doctors are shown up	Pass	-
2	User Selects one form the list	Doctor is shown pop up for a patient and clicks "ATTEND NOW"	Pass	-
3	Doctors selects the user	Secure Connection is set up for both of them	Pass	-

Post Condition : User is getting direct connection with doctor

Test Case (Simple Connection Test)

Test Case # : 03	Test Case Name : View Test	Page : 1 of 1
System : User Device	Sub-System : Prescription Generated	
Designed By : Rahul	Designed Date :22/09/18	
Executed by : BCS	Execution Date : 25/09/18	
Short Description : Test the prescription production		

Pre Condition : 1.User has successfully consulted doctor and clicked Get Prescription

STEP	ACTION	EXPECTED RESPONSE	PASS/FAIL	COMMENT
1	Click Get Prescription	System fetches the prescribed medicine and generate a prescription	Pass	-
2	User Selects View Now	Prescription is being shown on screen	Pass	-

Post Condition : User gets the prescription and a pop up to get it via email too
